- 1** Information access and retrieval: An architecture to support distributed data retrieval in specialized formats 77%

M. Brian Blake

**Proceedings of the 2003 ACM symposium on Applied computing** March 2003

Raw data and processed information are essential to the development of software simulation systems used in the analysis of various application domains. In such domains, the dissemination and management of this information is a daunting task. This paper discusses software architectural and specification-driven approaches to data retrieval in custom formats. Simulation developers use XML-based specification to request database results in any format.

David Maier, Jacob Stein, Allen Otis, Alan Purdy

**ACM SIGPLAN Notices, Conference proceedings on Object-oriented programming systems, languages and applications** June 1986

Volume 21 Issue 11

We describe the results of developing the GemStone object-oriented database server, which supports a model of objects similar to that of Smalltalk-80. We begin with a summary of the goals and requirements for the system: an extensible data model that captures behavioral semantics, no artificial bounds on the number or size of database objects, database amenities (concurrency, transactions, recovery, associative access,

authorization) and an interactive development environment. Object-orient ...

**5 Automatic logical navigation for relational databases** 77%

 Paul E. Reimers , Soon M. Chung  
**Proceedings of the 1993 ACM/SIGAPP symposium on Applied computing: states of the art and practice** March 1993

**6 Usage analysis: Duplicate detection in click streams** 77%

 Ahmed Metwally , Divyakant Agrawal , Amr El Abbadi  
**Proceedings of the 14th international conference on World Wide Web** May 2005  
 We consider the problem of finding duplicates in data streams. Duplicate detection in data streams is utilized in various applications including fraud detection. We develop a solution based on Bloom Filters [9], and discuss the space and time requirements for running the proposed algorithm in both the contexts of sliding, and landmark stream windows. We run a comprehensive set of experiments, using both real and synthetic click streams, to evaluate the performance of the proposed solution. The r ...

**7 Research sessions: non-standard query processing: Buffering database** 77%

 operations for enhanced instruction cache performance  
 Jingren Zhou , Kenneth A. Ross  
**Proceedings of the 2004 ACM SIGMOD international conference on Management of data** June 2004

As more and more query processing work can be done in main memory access is becoming a significant cost component of database operations. Recent database research has shown that most of the memory stalls are due to second-level cache data misses and first-level instruction cache misses. While a lot of research has focused on reducing the data cache misses, relatively little research has been done on improving the instruction cache performance of database systems. We first answer the question "Why ...

- 1** On aggregation issues in spatial data management 77%

M. Indulska , M. E. Orlowska  
**Australian Computer Science Communications , Proceedings of the thirteenth Australasian conference on Database technologies - Volume 5** January 2002  
 Volume 24 Issue 2  
 Large amounts of information can be overwhelming and costly process, especially when transmitting data over a network. A typical modern Geographical Information System (GIS) brings all types of data together based on the geographic component of the data and provides simple point-and-click query capabilities well as complex analysis tools. Querying a Geographical Information System, however, can be prohibitively expensive due to the large amounts of data which may need to be processed. Since the ...
- 2** Image Retrieval: Adaptive nearest neighbor search for relevance 77%

feedback in large image databases  
 P. Wu , B. S. Manjunath  
**Proceedings of the ninth ACM international conference on Multimedia** October 2001  
 Relevance feedback is often used in refining similarity retrievals in image and video databases. Typically this involves modification to the similarity metrics based on the user feedback and recomputing a set of nearest neighbors using the modified similarity values. Such nearest neighbor computations are expensive given that typical image features, such as color and texture, are represented in high dimensional spaces. Search complexity is a critical issue while dealing with large databases and ...
- 3** Recursive query processing using graph traversal techniques 77%

Estrella Pulido  
**Proceedings of the fifth international conference on Information and knowledge management** November 1996

**4 Towards a framework for integrating multilevel secure models and 77%****4 temporal data models**

Niki Pissinou , Kia Makki , E. K. Park

**Proceedings of the third international conference on Information and knowledge management** November 1994

Within many organizations the number of databases containing classified or otherwise sensitive data is increasing rapidly. Access to these databases must be restricted and controlled to limit the unauthorized disclosure, or malicious modification of data contained in them. However, the conventional models of authorization that have been designed for database systems supporting the hierarchical, network and relational models of data do not provide adequate mechanisms to support controlled ac ...
